FINAL REJECTION

Response to Applicant's Amendment

The rejection over Volk et al (US 5,999,020) is withdrawn in view of the amendments to the claims.

Claims Rejections

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-2, 4-5 and 16-21 are rejected under 35 USC 103(a) as being unpatentable over Takahashi et al (JP40927070).

Takahashi et al teaches an amplifier circuit in Figures 1-5 comprising a differential circuit (N3, N4, P3, P4), a current regulating circuit (P2, N6), a constant current source (P1, N5) and a even number of feedback delay elements (inverters V1, V3-V5) but does not disclose the limitation "the regulating circuit current increases an amount of the current flowing through the differential circuit in response to the node signal such that only rising delay time of the node signal is shortened". For example, the circuits in Figures 1 and 4 of Takashi have the structure similar to the claimed circuit as shown in Figures 6-7 of the present invention with exception of that Takashi employs fourth feedback delay elements (V1, V3-V4) instead of one feedback delay element (5) in the present invention. In order to meet the above recited limitation, only one

Application/Control Number: 09/385,014

Art Unit: 2816

inverter must be used in the circuit of Takahashi et la. However, a skilled artisan recognizes that the feedback delay elements in the circuit of Takashi is to used to provide a predetermined delay for the control time of the current sources (P2, N6) and the speed cycle time of the amplifier device is determined by the number of the feedback delay elements, see the Abstract. Since the number of the feedback delay elements is selectable, selecting the number of feedback delay elements of Takahashi et al for providing a predetermined speed cycle time required by a predetermined system in which the circuit of Takahashi et al is to be used is considered to be a matter of a design expedient for an engineer. It would have been obvious to a person having skill in the art at the time the invention was made to select one feedback delay element for the circuit of Takahashi et al for the purpose of increase the speed cycle time of the amplifier.

Claims 6-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Figure 1 of the applicant's admitted prior art in view of Takahashi et al (JP40927070).

Figure 1 of the admitted prior art shows a circuit comprising the amplifier (2a), and a processing signal circuit or a latch circuit (3) but does not discloses that the amplifiers have a current regulating circuit increases an amount of the current flowing through the differential circuit in response to the node signal such that only rising delay time of the node signal is shortened". Takahashi et al teaches a modified amplifier circuit as discussed above. It would have been obvious to a person having skill in the art at the time the invention was made to employ the modified amplifier circuit taught by Takahashi et al in the circuit of the admitted prior art for the purpose of increase the speed of cycle time. Note that, as notoriously well known in the art, the latch circuit or the processing signal circuit of the admitted prior art can be

Art Unit: 2816

duplicated to provide more output signals. Thus, duplicating the latch circuit of the circuit of the admitted prior art is a common practice for an engineer is considered to be a matter of the design expedient for the engineer depending upon a particular application. See *St. Regis Paper Co. v. Bemis Co.*, 193 USPQ 8. Noting that the phase difference between the output signal and the output signal of Takahashi et al is adjustable using the inverters. Therefore, adjusting the output phase same as the input phase for a particular environment would have been obvious to a person having skill in the art.

Response to Applicant's Arguments

The applicant argues that Takahashi et al does not discloses the claimed limitation "the differential circuit generates a node signal having a rising edge and a falling edge at the first drain in accordance with a current flowing through the first and second transistors" and "a node signal having rising edge and a falling edge is generated at the second node in accordance with a current flowing through the first and second transistors". The arguments are not persuasive because employing one feedback delay element in the circuit of Takahashi et al for the purpose of increasing the speed of cycle time to meet the claimed limitation is considered to be a matter of design expedient for an engineer as discussed above.

CONCLUSION

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

Application/Control Number: 09/385,014

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DINH T. LE whose telephone number is (571) 272-1745. The examiner can normally be reached on Monday-Friday (8AM-7PM).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, TIMOTHY CALLAHAN can be reached at (571) 272-1740.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
